Asigra Tigris Backup and Recovery Solutions for Service Providers

Ultra Secure Backup for Fast and Reliable Recovery

In a digital world, businesses are constant targets for attack. Ransomware, credentials phishing, and other cyberattacks can threaten your clients' data and viability.

Asigra Tigris is the most secure enterprise backup and recovery solution for protecting your client's data against potential data loss. Unlike other solutions, Tigris proactively hunts down ransomware and safeguards data backups from threats.

Integrated deep six security framework protects against ransomware and deeply embedded threats.

Tigris' agentless architecture makes deployment fast by eliminating the need to manage agents on hundreds of endpoints.

Full or incremental backup with near zero Recovery Point Objective (RPO) and fast Recovery Time Objective (RTO).

Fast Backup and Recovery

Tigris backs up and recovers data from multiple sources, including SaaS applications, on-premise apps and databases, virtual machines, and endpoints. Conduct full or incremental automated backups that achieve the optimal mix of fast RTO and RPO objectives.

A Foundation Built on Security

Asigra's integrated security offers a distinct advantage against modern threats that target backups and compromise your ability to recover your client's data. A combination of **Bidirectional Antimalware** scanning and **Content Disarm & Reconstruction** (CDR) scanning prevents dormant ransomware from reinfecting restored data.

Fast Deployment, Easily Managed

Asigra's centralized web-based-management console provides access to customizable settings, tailored reporting, and the features you need to effectively manage backup environments on a global or individual tenant level.

Clean Recovery When Needed

Be confident that data can be recovered quickly and without loss or corruption.

- **Restore Validation** verifies data integrity to ensure that recovery is accurate and complete.
- **Autonomic Healing** checks for backup corruption and ensures that the recovered data is clean and free of errors.
